```
1 import numpy as np
 2 import pdb
 5 This code was based off of code from cs231n at Stanford University, and modified for ece239as at UCLA.
 8 class KNN(object):
9
10
    def __init__(self):
11
12
    def train(self, X, y):
13
14
15
      self.X train = X
16
      self.y_train = y
17
18
    def compute_distances(self, X, norm=None):
19
20
      if norm is None:
21
       norm = lambda x: np.sqrt(np.sum(x**2))
22
        \#norm = 2
23
      num_test = X.shape[0]
24
      num_train = self.X_train.shape[0]
25
26
      dists = np.zeros((num_test, num_train))
27
      for i in np.arange(num_test):
28
29
        for j in np.arange(num train):
                             30
          # YOUR CODE HERE:
31
32
             Compute the distance between the ith test point and the jth
          # training point using norm(), and store the result in dists[i, j].
34
35
          dists[i,j] = norm(X[i] - self.X_train[j])
36
          pass
37
          # ------ #
38
39
          # END YOUR CODE HERE
40
          # ======== #
41
      return dists
42
43
44
    def compute_L2_distances_vectorized(self, X):
45
46
      Compute the distance between each test point in X and each training point
47
      in self.X train WITHOUT using any for loops.
48
49
      - X: A numpy array of shape (num_test, D) containing test data.
51
52
53
      - dists: A numpy array of shape (num_test, num_train) where dists[i, j]
54
        is the Euclidean distance between the ith test point and the jth training
55
56
57
      num test = X.shape[0]
      num_train = self.X_train.shape[0]
58
59
      dists = np.zeros((num_test, num_train))
60
61
      # YOUR CODE HERE:
62
      \# Compute the L2 distance between the ith test point and the jth
63
          training point and store the result in dists[i, j]. You may
64
65
          NOT use a for loop (or list comprehension). You may only use
66
           numpy operations.
67
68
           HINT: use broadcasting. If you have a shape (N,1) array and
      \# a shape (M,) array, adding them together produces a shape (N, M)
69
70
71
72
      dists = np.sqrt(((X**2).sum(axis=1,keepdims= True ))+ (self.X_train**2).sum(axis=1) - 2* X.dot(self.X_train.T))
73
      \#sum(||X-X_{train}||^2) can be written as above keeping in mind matrix multiplication dimensionality and broadcasting rules.
74
75
      pass
76
77
78
      # END YOUR CODE HERE
79
80
81
      return dists
82
83
    def predict_labels(self, dists, k=1):
84
85
      Given a matrix of distances between test points and training points,
```

```
87
       predict a label for each test point.
88
89
       Inputs:
90
       - dists: A numpy array of shape (num_test, num_train) where dists[i, j]
        gives the distance betwen the ith test point and the jth training point.
92
93
94
       - y: A numpy array of shape (num_test,) containing predicted labels for the
       test data, where y[i] is the predicted label for the test point X[i].
95
96
97
       num_test = dists.shape[0]
98
       y pred = np.zeros(num test)
99
       for i in np.arange(num_test):
100
        \# A list of length k storing the labels of the k nearest neighbors to
101
        # the ith test point.
102
        closest_y = []
        # ======= #
103
        # YOUR CODE HERE:
104
105
           Use the distances to calculate and then store the labels of
106
            the k-nearest neighbors to the ith test point. The function
107
            numpy.argsort may be useful.
108
            After doing this, find the most common label of the k-nearest
109
            neighbors. Store the predicted label of the ith training example
110
           as y_pred[i]. Break ties by choosing the smaller label.
111
112
        closest_y = list(self.y_train[np.argsort(dists[i])[:k]])
