Convolutional neural network layers

In this notebook, we will build the convolutional neural network layers. This will be followed by a spatial batchnorm, and then in the final notebook of this assignment, we will train a CNN to further improve the validation accuracy on CIFAR-10.

CS231n has built a solid API for building these modular frameworks and training them, and we will use their very well implemented framework as opposed to "reinventing the wheel." This includes using their Solver, various utility functions, their layer structure, and their implementation of fast CNN layers. This also includes nndl.fc_net, nndl.layers, and nndl.layer_utils. As in prior assignments, we thank Serena Yeung & Justin Johnson for permission to use code written for the CS 231n class (cs231n.stanford.edu).

```
In [2]: ## Import and setups
        import time
        import numpy as np
        import matplotlib.pyplot as plt
        from nndl.conv_layers import *
        from cs231n.data utils import get CIFAR10 data
        from cs231n.gradient_check import eval numerical gradient, eval numerica
        l gradient array
        from cs231n.solver import Solver
        %matplotlib inline
        plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
        plt.rcParams['image.interpolation'] = 'nearest'
        plt.rcParams['image.cmap'] = 'gray'
        # for auto-reloading external modules
        # see http://stackoverflow.com/questions/1907993/autoreload-of-modules-i
        n-ipython
        %load ext autoreload
        %autoreload 2
        def rel error(x, y):
          """ returns relative error """
          return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))
        ))))
```

The autoreload extension is already loaded. To reload it, use: %reload_ext autoreload

Implementing CNN layers

Just as we implemented modular layers for fully connected networks, batch normalization, and dropout, we'll want to implement modular layers for convolutional neural networks. These layers are in nndl/conv_layers.py.

Convolutional forward pass

Begin by implementing a naive version of the forward pass of the CNN that uses for loops. This function is conv_forward_naive in nndl/conv_layers.py. Don't worry about efficiency of implementation. Later on, we provide a fast implementation of these layers. This version ought to test your understanding of convolution. In our implementation, there is a triple for loop.

After you implement conv_forward_naive, test your implementation by running the cell below.

```
In [5]: x shape = (2, 3, 4, 4)
        w \text{ shape} = (3, 3, 4, 4)
        x = \text{np.linspace}(-0.1, 0.5, \text{num=np.prod}(x \text{ shape})).\text{reshape}(x \text{ shape})
        w = np.linspace(-0.2, 0.3, num=np.prod(w shape)).reshape(w shape)
        b = np.linspace(-0.1, 0.2, num=3)
        conv_param = {'stride': 2, 'pad': 1}
        out, _ = conv_forward_naive(x, w, b, conv_param)
        correct_out = np.array([[[[-0.08759809, -0.10987781],
                                     [-0.18387192, -0.2109216]],
                                    [[0.21027089, 0.21661097],
                                     [ 0.22847626, 0.23004637]],
                                    [[0.50813986, 0.54309974],
                                     [ 0.64082444, 0.67101435]]],
                                   [[-0.98053589, -1.03143541],
                                     [-1.19128892, -1.24695841]],
                                    [[0.69108355, 0.66880383],
                                     [0.59480972, 0.56776003]],
                                    [[ 2.36270298, 2.36904306],
                                     [ 2.38090835, 2.38247847]]]])
        # Compare your output to ours; difference should be around 1e-8
        print('Testing conv forward naive')
        print('difference: ', rel error(out, correct out))
```

```
Testing conv_forward_naive
('difference: ', 2.2121476417505994e-08)
```

Convolutional backward pass

Now, implement a naive version of the backward pass of the CNN. The function is <code>conv_backward_naive</code> in <code>nndl/conv_layers.py</code>. Don't worry about efficiency of implementation. Later on, we provide a fast implementation of these layers. This version ought to test your understanding of convolution. In our implementation, there is a quadruple <code>for</code> loop.

After you implement conv backward naive, test your implementation by running the cell below.

```
In [11]: x = np.random.randn(4, 3, 5, 5)
         w = np.random.randn(2, 3, 3, 3)
         b = np.random.randn(2,)
         dout = np.random.randn(4, 2, 5, 5)
         conv_param = {'stride': 1, 'pad': 1}
         out, cache = conv_forward_naive(x,w,b,conv_param)
         dx_num = eval_numerical_gradient_array(lambda x: conv_forward_naive(x, w
         , b, conv_param)[0], x, dout)
         dw num = eval numerical gradient array(lambda w: conv_forward naive(x, w
         , b, conv_param)[0], w, dout)
         db_num = eval_numerical_gradient_array(lambda b: conv_forward_naive(x, w
         , b, conv param)[0], b, dout)
         out, cache = conv_forward_naive(x, w, b, conv_param)
         dx, dw, db = conv backward naive(dout, cache)
         # Your errors should be around 1e-9'
         print('Testing conv backward naive function')
         print('dx error: ', rel_error(dx, dx_num))
         print('dw error: ', rel_error(dw, dw_num))
         print('db error: ', rel_error(db, db_num))
         Testing conv backward naive function
         ('dx error: ', 9.52394925623475e-09)
         ('dw error: ', 9.704958923846182e-10)
```

Max pool forward pass

In this section, we will implement the forward pass of the max pool. The function is max pool forward naive in nndl/conv layers.py. Do not worry about the efficiency of implementation.

After you implement max pool forward naive, test your implementation by running the cell below.

('db error: ', 3.7489601082852155e-11)

```
In [19]: x_{shape} = (2, 3, 4, 4)
         x = np.linspace(-0.3, 0.4, num=np.prod(x shape)).reshape(x shape)
         pool param = {'pool width': 2, 'pool height': 2, 'stride': 2}
         out, _ = max pool forward_naive(x, pool_param)
         correct_out = np.array([[[[-0.26315789, -0.24842105],
                                   [-0.20421053, -0.18947368]],
                                  [[-0.14526316, -0.13052632],
                                   [-0.08631579, -0.07157895]],
                                  [[-0.02736842, -0.01263158],
                                   [ 0.03157895, 0.04631579]]],
                                 [[[ 0.09052632, 0.10526316],
                                   [ 0.14947368, 0.16421053]],
                                  [[0.20842105, 0.22315789],
                                   [ 0.26736842, 0.28210526]],
                                  [[ 0.32631579, 0.34105263],
                                   [ 0.38526316, 0.4
                                                             1111)
         # Compare your output with ours. Difference should be around 1e-8.
         print('Testing max pool forward naive function:')
         print('difference: ', rel_error(out, correct_out))
```

Testing max_pool_forward_naive function:
('difference: ', 4.1666665157267834e-08)

Max pool backward pass

In this section, you will implement the backward pass of the max pool. The function is max_pool_backward_naive in nndl/conv_layers.py. Do not worry about the efficiency of implementation.

After you implement max pool backward naive, test your implementation by running the cell below.

Testing max_pool_backward_naive function: ('dx error: ', 3.2756263854194794e-12)

Fast implementation of the CNN layers

Implementing fast versions of the CNN layers can be difficult. We will provide you with the fast layers implemented by cs231n. They are provided in cs231n/fast_layers.py.

The fast convolution implementation depends on a Cython extension; to compile it you need to run the following from the cs231n directory:

```
python setup.py build_ext --inplace
```

NOTE: The fast implementation for pooling will only perform optimally if the pooling regions are non-overlapping and tile the input. If these conditions are not met then the fast pooling implementation will not be much faster than the naive implementation.

You can compare the performance of the naive and fast versions of these layers by running the cell below.

You should see pretty drastic speedups in the implementation of these layers. On our machine, the forward pass speeds up by 17x and the backward pass speeds up by 840x. Of course, these numbers will vary from machine to machine, as well as on your precise implementation of the naive layers.

```
In [22]: from cs231n.fast_layers import conv forward_fast, conv backward_fast
         from time import time
         x = np.random.randn(100, 3, 31, 31)
         w = np.random.randn(25, 3, 3, 3)
         b = np.random.randn(25,)
         dout = np.random.randn(100, 25, 16, 16)
         conv param = {'stride': 2, 'pad': 1}
         t0 = time()
         out naive, cache naive = conv forward naive(x, w, b, conv param)
         t1 = time()
         out_fast, cache_fast = conv_forward_fast(x, w, b, conv param)
         t2 = time()
         print('Testing conv_forward_fast:')
         print('Naive: %fs' % (t1 - t0))
         print('Fast: %fs' % (t2 - t1))
         print('Speedup: %fx' % ((t1 - t0) / (t2 - t1)))
         print('Difference: ', rel error(out naive, out fast))
         t0 = time()
         dx naive, dw naive, db naive = conv backward naive(dout, cache naive)
         t1 = time()
         dx fast, dw fast, db fast = conv backward fast(dout, cache fast)
         t2 = time()
         print('\nTesting conv backward fast:')
         print('Naive: %fs' % (t1 - t0))
         print('Fast: %fs' % (t2 - t1))
         print('Speedup: %fx' % ((t1 - t0) / (t2 - t1)))
         print('dx difference: ', rel_error(dx_naive, dx_fast))

```

Implementation of cascaded layers

We've provided the following functions in nndl/conv_layer_utils.py:

```
conv_relu_forwardconv_relu_backwardconv_relu_pool_forwardconv_relu_pool_backward
```

These use the fast implementations of the conv net layers. You can test them below:

```
In [24]: from nndl.conv_layer_utils import conv_relu_pool_forward, conv_relu_pool
         _backward
         x = np.random.randn(2, 3, 16, 16)
         w = np.random.randn(3, 3, 3, 3)
         b = np.random.randn(3,)
         dout = np.random.randn(2, 3, 8, 8)
         conv param = {'stride': 1, 'pad': 1}
         pool param = {'pool height': 2, 'pool width': 2, 'stride': 2}
         out, cache = conv relu pool forward(x, w, b, conv param, pool param)
         dx, dw, db = conv relu pool backward(dout, cache)
         dx num = eval numerical gradient array(lambda x: conv relu pool forward(
         x, w, b, conv_param, pool_param)[0], x, dout)
         dw num = eval numerical gradient array(lambda w: conv relu pool forward(
         x, w, b, conv_param, pool_param)[0], w, dout)
         db num = eval numerical gradient array(lambda b: conv relu pool forward(
         x, w, b, conv_param, pool_param)[0], b, dout)
         print('Testing conv relu pool')
         print('dx error: ', rel_error(dx_num, dx))
         print('dw error: ', rel_error(dw_num, dw))
         print('db error: ', rel_error(db_num, db))
```

```

         ('db error: ', 1.5098341437876588e-11)
```

What next?

We saw how helpful batch normalization was for training FC nets. In the next notebook, we'll implement a batch normalization for convolutional neural networks, and then finish off by implementing a CNN to improve our validation accuracy on CIFAR-10.

Spatial batch normalization

In fully connected networks, we performed batch normalization on the activations. To do something equivalent on CNNs, we modify batch normalization slightly.

Normally batch-normalization accepts inputs of shape (N, D) and produces outputs of shape (N, D), where we normalize across the minibatch dimension N. For data coming from convolutional layers, batch normalization accepts inputs of shape (N, C, H, W) and produces outputs of shape (N, C, H, W) where the N dimension gives the minibatch size and the (H, W) dimensions give the spatial size of the feature map.

How do we calculate the spatial averages? First, notice that for the C feature maps we have (i.e., the layer has C filters) that each of these ought to have its own batch norm statistics, since each feature map may be picking out very different features in the images. However, within a feature map, we may assume that across all inputs and across all locations in the feature map, there ought to be relatively similar first and second order statistics. Hence, one way to think of spatial batch-normalization is to reshape the (N, C, H, W) array as an (N*H*W, C) array and perform batch normalization on this array.

Since spatial batch norm and batch normalization are similar, it'd be good to at this point also copy and paste our prior implemented layers from HW #4. Please copy and paste your prior implemented code from HW #4 to start this assignment. If you did not correctly implement the layers in HW #4, you may collaborate with a classmate to use their implementations from HW #4. You may also visit TA or Prof OH to correct your implementation.

You'll want to copy and paste from HW #4:

- layers.py for your FC network layers, as well as batchnorm and dropout.
- layer utils.py for your combined FC network layers.
- optim.py for your optimizers.

Be sure to place these in the nnd1/ directory so they're imported correctly. Note, as announced in class, we will not be releasing our solutions.

If you use your prior implementations of the batchnorm, then your spatial batchnorm implementation may be very short. Our implementations of the forward and backward pass are each 6 lines of code.

CS231n has built a solid API for building these modular frameworks and training them, and we will use their very well implemented framework as opposed to "reinventing the wheel." This includes using their Solver, various utility functions, their layer structure, and their implementation of fast CNN layers. This also includes nndl.fc_net, nndl.layers, and nndl.layer_utils. As in prior assignments, we thank Serena Yeung & Justin Johnson for permission to use code written for the CS 231n class (cs231n.stanford.edu).

        def rel_error(x, y):
          """ returns relative error """
          return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))
        ))))
```

Spatial batch normalization forward pass

Implement the forward pass, spatial_batchnorm_forward in nndl/conv_layers.py. Test your implementation by running the cell below.

```
In [15]: # Check the training-time forward pass by checking means and variances
         # of features both before and after spatial batch normalization
         N, C, H, W = 2, 3, 4, 5
         x = 4 * np.random.randn(N, C, H, W) + 10
         print('Before spatial batch normalization:')
         print(' Shape: ', x.shape)
         print(' Means: ', x.mean(axis=(0, 2, 3)))
                  Stds: ', x.std(axis=(0, 2, 3)))
         print('
         # Means should be close to zero and stds close to one
         gamma, beta = np.ones(C), np.zeros(C)
         bn param = {'mode': 'train'}
         out, _ = spatial batchnorm forward(x, gamma, beta, bn param)
         print('After spatial batch normalization:')
         print(' Shape: ', out.shape)
         print(' Means: ', out.mean(axis=(0, 2, 3)))
         print(' Stds: ', out.std(axis=(0, 2, 3)))
         # Means should be close to beta and stds close to gamma
         gamma, beta = np.asarray([3, 4, 5]), np.asarray([6, 7, 8])
         out, _ = spatial batchnorm forward(x, gamma, beta, bn param)
         print('After spatial batch normalization (nontrivial gamma, beta):')
         print(' Shape: ', out.shape)
         print(' Means: ', out.mean(axis=(0, 2, 3)))
         print(' Stds: ', out.std(axis=(0, 2, 3)))
```

```
Before spatial batch normalization:
(' Shape: ', (2, 3, 4, 5))
(' Means: ', array([10.11007759, 9.35884986, 10.14078303]))
(' Stds: ', array([3.64895311, 3.80273697, 2.25507063]))
After spatial batch normalization:
(' Shape: ', (2, 3, 4, 5))
(' Means: ', array([ 2.14064877e-16, -4.57966998e-16, -1.80411242e-16]))
(' Stds: ', array([0.99999962, 0.99999965, 0.99999902]))
After spatial batch normalization (nontrivial gamma, beta):
(' Shape: ', (2, 3, 4, 5))
(' Means: ', array([6., 7., 8.]))
(' Stds: ', array([2.99999887, 3.99999862, 4.99999508]))
```

Spatial batch normalization backward pass

Implement the backward pass, spatial_batchnorm_backward in nndl/conv_layers.py. Test your implementation by running the cell below.

```
In [17]: N, C, H, W = 2, 3, 4, 5
         x = 5 * np.random.randn(N, C, H, W) + 12
         gamma = np.random.randn(C)
         beta = np.random.randn(C)
         dout = np.random.randn(N, C, H, W)
         bn_param = {'mode': 'train'}
         fx = lambda x: spatial batchnorm forward(x, gamma, beta, bn param)[0]
         fg = lambda a: spatial batchnorm forward(x, gamma, beta, bn param)[0]
         fb = lambda b: spatial_batchnorm_forward(x, gamma, beta, bn_param)[0]
         dx num = eval numerical gradient array(fx, x, dout)
         da_num = eval_numerical_gradient_array(fg, gamma, dout)
         db num = eval numerical gradient array(fb, beta, dout)
         _, cache = spatial_batchnorm_forward(x, gamma, beta, bn_param)
         dx, dgamma, dbeta = spatial batchnorm backward(dout, cache)
         print('dx error: ', rel_error(dx_num, dx))
         print('dgamma error: ', rel_error(da_num, dgamma))
         print('dbeta error: ', rel error(db num, dbeta))
         ('dx error: ', 6.015817725060696e-08)
```

```
('dgamma error: ', 6.01581//25060696e-08)
('dgamma error: ', 1.3769169556026553e-12)
('dbeta error: ', 5.827940219536585e-12)
```

Convolutional neural networks

In this notebook, we'll put together our convolutional layers to implement a 3-layer CNN. Then, we'll ask you to implement a CNN that can achieve > 65% validation error on CIFAR-10.

CS231n has built a solid API for building these modular frameworks and training them, and we will use their very well implemented framework as opposed to "reinventing the wheel." This includes using their Solver, various utility functions, their layer structure, and their implementation of fast CNN layers. This also includes nndl.fc_net, nndl.layers, and nndl.layer_utils. As in prior assignments, we thank Serena Yeung & Justin Johnson for permission to use code written for the CS 231n class (cs231n.stanford.edu).

If you have not completed the Spatial BatchNorm Notebook, please see the following description from that notebook:

Please copy and paste your prior implemented code from HW #4 to start this assignment. If you did not correctly implement the layers in HW #4, you may collaborate with a classmate to use their layer implementations from HW #4. You may also visit TA or Prof OH to correct your implementation.

You'll want to copy and paste from HW #4:

- layers.py for your FC network layers, as well as batchnorm and dropout.
- layer_utils.py for your combined FC network layers.
- optim.py for your optimizers.

Be sure to place these in the nnd1/ directory so they're imported correctly. Note, as announced in class, we will not be releasing our solutions.

```
In [11]: # As usual, a bit of setup
         import numpy as np
         import matplotlib.pyplot as plt
         from nndl.cnn import *
         from cs231n.data utils import get CIFAR10 data
         from cs231n.gradient_check import eval numerical_gradient_array, eval_nu
         merical gradient
         from nndl.layers import *
         from nndl.conv_layers import *
         from cs231n.fast layers import *
         from cs231n.solver import Solver
         %matplotlib inline
         plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
         plt.rcParams['image.interpolation'] = 'nearest'
         plt.rcParams['image.cmap'] = 'gray'
         # for auto-reloading external modules
         # see http://stackoverflow.com/questions/1907993/autoreload-of-modules-i
         n-ipython
         %load_ext autoreload
         %autoreload 2
         def rel_error(x, y):
            """ returns relative error """
           return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))
         ))))
         The autoreload extension is already loaded. To reload it, use:
           %reload ext autoreload
In [12]: # Load the (preprocessed) CIFAR10 data.
         data = get CIFAR10 data()
         for k in data.keys():
           print('{}: {} '.format(k, data[k].shape))
         X val: (1000, 3, 32, 32)
         X train: (49000, 3, 32, 32)
         X_test: (1000, 3, 32, 32)
         y val: (1000,)
         y_train: (49000,)
         y_test: (1000,)
```

Three layer CNN

In this notebook, you will implement a three layer CNN. The ThreeLayerConvNet class is in nnd1/cnn.py. You'll need to modify that code for this section, including the initialization, as well as the calculation of the loss and gradients. You should be able to use the building blocks you have either earlier coded or that we have provided. Be sure to use the fast layers.

The architecture of this CNN will be:

```
conv - relu - 2x2 max pool - affine - relu - affine - softmax
```

We won't use batchnorm yet. You've also done enough of these to know how to debug; use the cells below.

Note: As we are implementing several layers CNN networks. The gradient error can be expected for the eval_numerical_gradient() function. If your W1 max relative error and W2 max relative error are around or below 0.01, they should be acceptable. Other errors should be less than 1e-5.

```
In [19]: num inputs = 2
         input_dim = (3, 16, 16)
         reg = 0.0
         num classes = 10
         X = np.random.randn(num_inputs, *input_dim)
         y = np.random.randint(num classes, size=num inputs)
         model = ThreeLayerConvNet(num filters=3, filter size=3,
                                    input dim=input dim, hidden dim=7,
                                    dtype=np.float64)
         loss, grads = model.loss(X, y)
         for param name in sorted(grads):
             f = lambda : model.loss(X, y)[0]
             param grad num = eval numerical gradient(f, model.params[param name
         ], verbose=False, h=1e-6)
             e = rel error(param grad num, grads[param name])
             print('{} max relative error: {}'.format(param name, rel error(param
         grad num, grads[param name])))

```

Get > 65% validation accuracy on CIFAR-10.

In the last part of the assignment, we'll now ask you to train a CNN to get better than 65% validation accuracy on CIFAR-10.

Things you should try:

- Filter size: Above we used 7x7; but VGGNet and onwards showed stacks of 3x3 filters are good.
- Number of filters: Above we used 32 filters. Do more or fewer do better?
- Batch normalization: Try adding spatial batch normalization after convolution layers and vanilla batch normalization aafter affine layers. Do your networks train faster?
- Network architecture: Can a deeper CNN do better? Consider these architectures:
 - [conv-relu-pool]xN conv relu [affine]xM [softmax or SVM]
 - [conv-relu-pool]XN [affine]XM [softmax or SVM]
 - [conv-relu-conv-relu-pool]xN [affine]xM [softmax or SVM]

Tips for training

For each network architecture that you try, you should tune the learning rate and regularization strength. When doing this there are a couple important things to keep in mind:

- If the parameters are working well, you should see improvement within a few hundred iterations
- Remember the coarse-to-fine approach for hyperparameter tuning: start by testing a large range of hyperparameters for just a few training iterations to find the combinations of parameters that are working at all.
- Once you have found some sets of parameters that seem to work, search more finely around these parameters. You may need to train for more epochs.

```

 6 This code was originally written for CS 231n at Stanford University
  (cs231n.stanford.edu). It has been modified in various areas for use in the
8 ECE 239AS class at UCLA. This includes the descriptions of what code to
9 implement as well as some slight potential changes in variable names to be
10 consistent with class nomenclature. We thank Justin Johnson & Serena Yeung for
11 permission to use this code. To see the original version, please visit
12 cs231n.stanford.edu.
13 """
14
15 def conv_forward_naive(x, w, b, conv_param):
16
17
    A naive implementation of the forward pass for a convolutional layer.
18
19
    The input consists of N data points, each with C channels, height H and width
    W. We convolve each input with F different filters, where each filter spans
20
    all C channels and has height HH and width HH.
21
22
23
    Input:
24
    - x: Input data of shape (N, C, H, W)
25
    - w: Filter weights of shape (F, C, HH, WW)
26
    - b: Biases, of shape (F,)
27
    - conv_param: A dictionary with the following keys:
      - 'stride': The number of pixels between adjacent receptive fields in the
28
29
       horizontal and vertical directions.
30
      - 'pad': The number of pixels that will be used to zero-pad the input.
31
32
    Returns a tuple of:
    - out: Output data, of shape (N, F, H', W') where H' and W' are given by
33
      H' = 1 + (H + 2 * pad - HH) / stride
34
35
      W' = 1 + (W + 2 * pad - WW) / stride
36
    - cache: (x, w, b, conv_param)
37
38
39
    pad = conv_param['pad']
40
    stride = conv_param['stride']

20
21 class ThreeLayerConvNet(object):
22
23
    A three-layer convolutional network with the following architecture:
24
25
    conv - relu - 2x2 max pool - affine - relu - affine - softmax
26
    The network operates on minibatches of data that have shape (N, C, H, W)
27
    consisting of N images, each with height H and width W and with C input
28
29
    channels.
30
31
    def __init__(self, input_dim=(3, 32, 32), num_filters=32, filter_size=7,
32
                 hidden dim=100, num classes=10, weight scale=1e-3, reg=0.0,
33
34
                 dtype=np.float32, use_batchnorm=False):
35
36
      Initialize a new network.
37
38
      Inputs:
      - input dim: Tuple (C, H, W) giving size of input data
39
      - num filters: Number of filters to use in the convolutional layer
40
      - filter size: Size of filters to use in the convolutional layer
41
      - hidden_dim: Number of units to use in the fully-connected hidden layer
42
      - num_classes: Number of scores to produce from the final affine layer.
43
44
      - weight scale: Scalar giving standard deviation for random initialization
45
        of weights.
46
      - reg: Scalar giving L2 regularization strength
47
      - dtype: numpy datatype to use for computation.
