 4 """
 5 This code was originally written for CS 231n at Stanford University
 6 (cs231n.stanford.edu). It has been modified in various areas for use in the
 7 ECE 239AS class at UCLA. This includes the descriptions of what code to
 8 implement as well as some slight potential changes in variable names to be
9 consistent with class nomenclature. We thank Justin Johnson & Serena Yeung for
10 permission to use this code. To see the original version, please visit
11 cs231n.stanford.edu.
12 """
13
14 class TwoLayerNet(object):
15
     A two-layer fully-connected neural network. The net has an input dimension of
16
17
     N, a hidden layer dimension of H, and performs classification over C classes.
18
     We train the network with a softmax loss function and L2 regularization on the
19
     weight matrices. The network uses a ReLU nonlinearity after the first fully
20
     connected layer.
21
22
     In other words, the network has the following architecture:
23
24
     input - fully connected layer - ReLU - fully connected layer - softmax
25
26
     The outputs of the second fully-connected layer are the scores for each class.
27
28
29
         __init__(self, input_size, hidden_size, output_size, std=1e-4):
30
31
       Initialize the model. Weights are initialized to small random values and
       biases are initialized to zero. Weights and biases are stored in the
32
33
       variable self.params, which is a dictionary with the following keys:
34
35
       W1: First layer weights; has shape (H, D)
36
       bl: First layer biases; has shape (H,)
       W2: Second layer weights; has shape (C, H)
37
       b2: Second layer biases; has shape (C,)
38
39
40
       Inputs:
       - input size: The dimension D of the input data.
41
       - hidden size: The number of neurons H in the hidden layer.
42
       - output size: The number of classes C.
43
44
45
       np.random.seed(0)
       self.params = {}
46
47
       self.params['W1'] = std * np.random.randn(hidden size, input size)
48
       self.params['b1'] = np.zeros(hidden size)
49
       self.params['W2'] = std * np.random.randn(output size, hidden size)
50
       self.params['b2'] = np.zeros(output size)
51
52
53
     def loss(self, X, y=None, reg=0.0):
54
55
       Compute the loss and gradients for a two layer fully connected neural
56
       network.
57
58
      Inputs:
       - X: Input data of shape (N, D). Each X[i] is a training sample.
59
60
       - y: Vector of training labels. y[i] is the label for X[i], and each y[i] is
         an integer in the range 0 \le y[i] \le C. This parameter is optional; if it
61
62
         is not passed then we only return scores, and if it is passed then we
63
         instead return the loss and gradients.
64
       - reg: Regularization strength.
65
66
       Returns:
67
       If y is None, return a matrix scores of shape (N, C) where scores[i, c] is
68
       the score for class c on input X[i].
```
